

NIXIE CLOCK - SPECIAL EDITION WITH WOODEN LASER CUT ENCLOSURE

Total solder points: 230 + 74
Difficulty level: *beginner* 1 2 3 4 5 *advanced*

ILLUSTRATED ASSEMBLY MANUAL

H8099SEIP-1

Grab your chance NOW, build your own nixie clock. Limited edition!

What are 'nixie'-tubes ?

Nixie tubes are the 'LED indicators' of the past. In the 50's, 60's and early 70's there were no LEDs or LCDs. Neon gas filled tubes were used to display numerical data. They were part of scientific equipment, counters, voltmeters, control panels etc... Nixies feature a characteristic warm orange glow. They are no longer in production, which explains their price.

Features

- ☑ High Quality nixie tubes
- ☑ Microprocessor controlled
- ☑ Neon HH:MM separator
- ☑ Accurate timekeeping
- ☑ Economy "tube blank" option

Specifications

- Display tubes: NOS Siemens ZM1336K
- Anode HT: +180VDC
- 12h/24h displaying (selectable)
- 50/60Hz AC power sync (auto-detect)
- Power supply: 9-12VAC / 300mA (option) (e.g. PS1205AC)
- Dimensions (lxwxh): 110x55x60mm

1. Assembly (Skipping this can lead to troubles !)

Ok, so we have your attention. These hints will help you to make this project successful. Read them carefully.

1.1 Make sure you have the right tools:

- A good quality soldering iron (25-40W) with a small tip.
- Wipe it often on a wet sponge or cloth, to keep it clean; then apply solder to the tip, to give it a wet look. This is called 'thinning' and will protect the tip, and enables you to make good connections. When solder rolls off the tip, it needs cleaning.
- Thin raisin-core solder. Do not use any flux or grease.
- A diagonal cutter to trim excess wires. To avoid injury when cutting excess leads, hold the lead so they cannot fly towards the eyes.
- Needle nose pliers, for bending leads, or to hold components in place.
- Small blade and Phillips screwdrivers. A basic range is fine.

For some projects, a basic multi-meter is required, or might be handy

1.2 Assembly Hints :

- ⇒ Make sure the skill level matches your experience, to avoid disappointments.
- ⇒ Follow the instructions carefully. Read and understand the entire step before you perform each operation.
- ⇒ Perform the assembly in the correct order as stated in this manual
- ⇒ Position all parts on the PCB (Printed Circuit Board) as shown on the drawings.
- ⇒ Values on the circuit diagram are subject to changes.
- ⇒ Values in this assembly guide are correct*
- ⇒ Use the check-boxes to mark your progress.
- ⇒ Please read the included information on safety and customer service

* Typographical inaccuracies excluded. Always look for possible last minute manual updates, indicated as 'NOTE' on a separate leaflet.

1.3 Soldering Hints :

1- Mount the component against the PCB surface and carefully solder the leads

2- Make sure the solder joints are cone-shaped and shiny

3- Trim excess leads as close as possible to the solder joint

REMOVE THEM FROM THE TAPE ONE AT A TIME !

**AXIAL COMPONENTS ARE TAPED IN THE
CORRECT MOUNTING SEQUENCE !**

IMPORTANT!

- ⚡ This kit generates high voltages. Always use a suitable enclosure for this kit!
- ⚡ The Kit consists of 2 boards. One for the electronics and one for the Nixie, display tubes

Unpack, inspect and handle the tubes with care!

All components are mounted on a "double side" PC-board.

Components on double sided boards are hard to remove, therefore, **DOUBLE** check each component before soldering!!!

HINT : The display PCB for the tubes features a tube centre hole, this hole can be used as template to drill the tube holes in the enclosure

MAIN BOARD

1. Diodes. Watch the polarity!

- D1 : 1N4007
- D2 : 1N4007
- D3 : 1N4007
- D4 : 1N4007
- D5 : 1N4148!!!**

2. Horizontal resistors

- R1 : 10K (1-0-3-B)
- R2 : 10K (1-0-3-B)
- R3 : 10K (1-0-3-B)
- R4 : 10K (1-0-3-B)
- R5 : 10K (1-0-3-B)
- R6 : 100K (1-0-4-B)
- R7 : 390K (3-9-4-B)
- R8 : 1K (1-0-2-B)
- R9 : 1K (1-0-2-B)
- R10 : 1K (1-0-2-B)
- R11 : 330K (3-3-4-B)
- R12 : 10 (1-0-0-B)
- R13 : 3K (3-0-0-1-1)

3. Fast diode. Watch the polarity!

4. IC socket. Watch the position of the notch!

5. Capacitors.

6. Voltage regulator

7. MOSFET transistors

8. Transistors

9. Vertical resistors

10. Switch

11. Connector

□ SK1

12. Coil

□ L1 : 330 μ H

13. Electrolytic Capacitor. Watch the polarity !

□ C7 : 220 μ F/25V
□ C8 : 2.2 μ F to 4.7 μ F /
350V or higher

14. Fuse.

□ F1 : 1A

15. Jumper

If a steady "seconds"
Neon indicator is
wanted, then mount
a jumper at position
SK2.

16. IC. Watch the position of the notch!

VK8099

□ IC1 :

17. Main board test

**!!CAUTION HIGH VOLTAGES!!
DO NOT TOUCH THE BOARD**

Connect a 12Vac (not DC!) adaptor to the board. Carefully measure about 180Vdc between ground (eg metal part of VR1) and cathode (white stripe) of D6.

In case of failure:

- Check the fuse
- Check the +5Vdc voltage over C2 & C4
- Position of IC1
- Solderings and component position

DISPLAY PCB

1. Female header connector

2 Tubes

- Mount the nixie tubes as straight as possible
- Take care not to bend the leads!
- First solder 1 connection of EACH tube
- Align and straighten the tubes, then solder a second connection
- Check the alignment again and solder the remaining connections

3. Neon tube

Mount the neon tube as straight as possible.

ASSEMBLY

Cut the pin header at position 17 so that 16 contacts are left.

Insert the header into the display board connector.

Assemble both PCBs using 4 spacers and 8 screws, make sure that the 16 pins come through the main board holes.

Solder the connector to the main board, and cut the connector left over.

FINAL TEST

Connect the 12Vac to the board, if all works well, the displays should light. Check the user manual for further set-up

CONFIGURING AND SETTING YOUR CLOCK

1

Apply 9-12VAC.

The clock will display '50' or '60' for 3s, depending on the AC power frequency (Hz) in your area. This indicates that the zero cross detection part of the clock circuit is working fine.

(If the clock displays '00', you either applied a DC voltage instead of an AC voltage, or there is a problem with the zero cross detection circuit T1, R1, R2, R6, C3, D5)

2

Next, the clock will show the display mode for 3s

Press the button briefly to toggle between 12h and 24h display mode.

WARNING: This is a high voltage device !

Do not touch anything else than the plastic part of the pushbutton while the clock is plugged in.

The display mode is stored in eeprom and will be remembered at next power on.

50Hz AC: OK

DC applied or zero cross error

24h system selected

12h system selected

3

To save energy and extend tube life, the unit allows you to blank the display for certain periods (e.g. at night, while you are absent, etc...) The digits on the left hand side of the separator indicate the hours (00 to 23).

By pressing the button briefly, you can toggle between 'show this hour' and 'don't show this hour', for each hour of the day. Hours advance automatically every second at button release.

Default the display is blanked between 1 and 6 in the morning. Settings are stored in eeprom and will be remembered at next power on.

Now you can set the clock. Press and hold the button to advance. After a couple of seconds, the unit advances fast. At release, seconds start from '00'.

Setting the clock when the display is blanked: If the display was blanked, it will turn on when the time set button is pressed. At release, the display will stay on for 5s after which it will blank again.

Note: Separator will be active at all times, also when the display is blanked, to indicate that the high voltage is present.

As there is no AM/PM indicator, during time setting the unit always switches to 24h mode, even if 12h mode was selected. At release, unit returns to 12h mode.
